

EXPERIMENT NO: 01 - Acquisition of Volatile and Non-Volatile Memory Disk Images Using FTK Imager

DATE:

1. AIM

To perform a complete forensic acquisition and analysis lifecycle by imaging non-volatile storage using AccessData FTK Imager, capturing live volatile memory (RAM) using the WinPmem command-line utility, and analyzing the extracted memory dump using Volatility 3 commands via the PassMark Volatility Workbench.

2. SOFTWARE / TOOLS REQUIRED

- **Operating System:** Windows OS
- **Forensics Tools:**
 - AccessData FTK Imager (GUI for non-volatile physical drive imaging)
 - WinPmem (winpmem_mini_x64_rc2.exe) (CLI tool for volatile memory capture)
 - Volatility 3 Framework (vol.exe / PassMark Volatility Workbench V3.0)
- **Hardware:** Evidence PC/Workstation, Target Storage Drive (hp v221w 16GB USB Device).

3. DESCRIPTION

A thorough digital forensic investigation requires collecting both data at rest and data in motion using strict operational procedures.

- **Non-Volatile Memory Acquisition:** AccessData FTK Imager creates mathematically verifiable, bit-by-bit physical images of storage devices (saved as Raw/dd) without altering the original evidence.
- **Volatile Memory (RAM) Acquisition:** Command-line utilities like **WinPmem** load a specialized kernel driver (pme98A2.tmp) to read physical memory directly. Executing this via CMD writes active processes, network connections, and decrypted keys to a raw dump file (.raw).

- **Volatile Memory Analysis (CLI): Volatility 3** is a framework for analyzing RAM dumps. By passing specific parameters and plugins (e.g., -f <image_path> windows.pslist.PsList) into the command line or workbench, investigators can reconstruct the system's live state and identify suspicious processes.

4. PROCEDURE

Part A: Acquiring Volatile Memory (Disk Image) using FTK Imager

1. Launch **FTK Imager** as an Administrator.
2. Click the **Capture Memory** icon on the top toolbar.

3. Click **Browse** under *Destination path* to select the output folder and type the output file name (e.g., memdump.mem).

4. (Optional) Check **Include pagefile** (pagefile.sys) and **Create AD1 file** if required for the investigation.
5. Click **Capture Memory** to begin acquisition.

6. Wait until the process finishes; the captured memory will be saved with a .mem extension.

Part B: Acquiring Non-Volatile Memory (Disk Image)

1. In FTK Imager, click **File > Create Disk Image** (or click the toolbar icon).

2. Select the **Source Evidence Type** (e.g., *Physical Drive* or *Logical Drive*) and click **Next**.

3. Select the target drive from the dropdown list and click **Finish**.

4. Click **Add...** to configure the image destination:

Select the Image Type (e.g., **Raw (dd)**, **E01**, **SMART**, or **AFF**) and click **Next**.

Fill in the *Evidence Item Information* (Case Number, Evidence Number, Examiner Name, Notes) and click **Next**.

Image Source

Evidence Item Information

Case Number: 99240041226

Evidence Number: 1

Unique Description: file

Examiner: Daggubati Sadhan

Notes:

< Back Next > Cancel Help

Specify the **Image Destination Folder** and **Image Filename**.

Image Source

Select Image Destination

Image Destination Folder

C:\Users\Public\Documents Browse

Image Filename (Excluding Extension)

diskimage

Image Fragment Size (MB) 1500

For Raw, E01, and AFF formats: 0 = do not fragment

Compression (0=None, 1=Fastest, 9=Smallest) 0

Use AD Encryption ☐

< Back Finish Cancel Help

Set **Image Fragment Size (MB)** (set to 0 to keep the file unfragmented as a single image, or leave default values like 1500).

Click **Finish**.

5. Check the box **Verify images after they are created** to ensure hash integrity matching.

6. Click **Start** to begin the disk imaging process.

7. Once creation finishes, view the **Image Summary** dialog to confirm that computed MD5 and SHA1 checksums match between the source and created image.

6. RESULT

A complete digital forensics acquisition and analysis workflow was successfully executed via a combination of GUI and CLI tools. The target physical USB drive was securely imaged and verified using FTK Imager. Simultaneously, the system's live RAM was extracted via the Command Prompt using WinPmem. Finally, Volatility 3 command-line syntax was utilized to parse the raw memory file, successfully recovering critical live-state artifacts, including the process list and execution timestamps.
